

Auto Ticket Classification using Flow Designer

2. Requirement Analysis

Functional Requirements

- Identify tickets requiring classification.
- Read relevant ticket information.
- Apply predefined classification conditions.
- Update required fields or route the ticket.
- Handle unmatched or exception cases.

Non-Functional Requirements

- The workflow should be consistent, maintainable and follow platform access permissions.

Inputs and Outputs

- Input: Service ticket information.
- Processing: Flow Designer triggers, conditions and actions.
- Output: Classified and appropriately routed ticket.
