

Auto Ticket Classification using Flow Designer

3. Project Design Phase

High-Level Design

- Ticket creation or update triggers the flow.
- The flow evaluates relevant ticket fields.
- A matching condition performs the corresponding update or routing action.
- The flow ends after classification or exception handling.

Main Components

- Ticket record, Flow Designer trigger, classification conditions, actions, and fallback path.

Design Principle

- Keep rules modular so new categories or routing conditions can be added easily.
